

## MR Brain W/IV Contrast ONLY

MR BRAIN, WITH CONTRAST:

TECHNIQUE: Following intravenous contrast administration, axial volumetric T1 gradient echo and 3D TSE T2 imaging were performed through the entire brain on a 1.5 Tesla system.

FINDINGS:

Allowing for differences in technique, there has been no significant interval change. Again noted is the abnormal heterogenous mass in the right superior parietal lobe. The mass demonstrates an irregular appearing enhancing nodular soft tissue component with a cystic component. The mass demonstrates a small amount of adjacent edema.

## IMPRESSION

Successful completion of surgical guidance protocol.

No significant change in the right superior parietal lobe tumor.

I have personally reviewed the images and agree with the interpretation.
